

Update 1

Changelog

1. General Information

Avira Free Mac Security, version 2 update 1 (version number 2.0.1) will be released on October 15th, 2013 prior to or about the same time that Apple presumably releases the new Mac OSX 10.9 (Maverick).

2. Features and fixes

Version 2, update 1 will support the new Mac OSX 10.9 (Maverick). Avira Free Mac Security users who want to switch to Mac OSX 10.9 should keep the following in mind:

- As a general rule users should always update their Avira Free Mac Security installation to version 2.0.1 before updating their operating system to Mac OSX 10.9.
- Updating from version 1.0 to the version 2.0.1:
 1. Download the version 2.0.1 from the Avira website
 2. Uninstall version 1.0 by dragging the avira.app from the applications folder to the trash. The uninstall routine starts automatically, just follow the different steps in the uninstallation wizard
 3. Install version 2.0.1 by going to the download location, click on the installation package and follow the different steps on the installation wizard
 4. Wait till the installation is finished and only then upgrade your operating system to Mac OSX 10.9 (Maverick)
- Updating from version 2.0 to the version 2.0.1:
 1. Open the application main user interface by clicking the Avira dock icon or by going to the menu bar or the dock icon, do a right-click and choose the menu entry Open Avira
 2. Go to the navigation bar, chose "Update" and click Update now
 3. Wait till the update is finished and only then upgrade your operating system to Mac OSX 10.9
- How do you find your version number?
 - Click **Avira** in the menu bar
 - Click **About Avira**
 - Find the version number in the window that is opened

3. Random serial number and user agent string update

- In version 1.0 and version 2.0 the transfer of the random serial number and the product version did not work as intended. These issues were fixed:
 - When contacting the backend version 2.0.1 now transfers only one unique random serial number for every installation. This random serial number is now 40 digits long
 - When contacting the backend version 2.0.1 now also transfers the product version using the 4 digits dotted notation x.x.x.x
 - Update 1 now also uses the latest version of the user agent string

4. Fixes

- An issue where authentication (necessary e.g. for changing the preferences or doing a product update) did not work on Mac OSX 10.9 was fixed
- Product, engine and VDF version are now correctly shown in the start page after an update
- A minor formatting issue in the license dialogue of the installation was fixed
- An issue in the quarantine where a message showed mixed German and English text was fixed
