

Avira

Avira Version 2014
(Update 3)

Changelogs

General information

Avira Version 2014, Update 3 will contain the following changes:

1. Integration of APC in Avira Free Antivirus

With the integration of APC (Avira Protection Cloud) in Avira Free Antivirus we will provide the same protection to all users. This affects not only the product and the Avira Protection Cloud but also „MyAccount“ since the authentication needs to be accomplished as well.

2. AIRS Redesign

AIRS (Avira Intelligent Repair System) is a refactoring and improvement of the current repair functionality in all Avira Windows products.

AIRS will change the repair that it corresponds to current technology of malware and we are also able to react faster in repair and removal issues to clean up the infected users.

The first TechPreview gives you the opportunity to already test this new functionality before others do. The first version includes all necessary registry functionality. For example with AIRS, we are able to delete random generated Registry keys from malware infection which was not possible before. Another highlight in AIRS is that we improved the option to change/ delete as well as create all security changes in the registry which are not located to the malicious infected path, but definitely made by malware.

3. New Features

- Enhance the User Agent String with the Machine UID
- User Agent String: enhance it with default browser
- Track Configuration Center open and close
- Track Control Center open and close
- Track if the user clicks the Scan Now button in Control Center

4. Bug fixes

- 100% CPU load caused by MailGuard with some Email servers fixed
- Outlook 2003 & 2010 IMAP email fetching is blocked by MailGuard fixed
- On Demand scanner crashes when more than 4 partitions on a single drive fixed
- On Access scanner is not deleting temporary files during startup fixed
- Complete logging does not work for on access scanner fixed
