

The only notable change that has been performed in this release, was the removal of the 4th option “Do not download product updates” from the Product Update configuration.

This means that from this release onward, it is no longer possible to postpone the product updates eternally.

It prevents the situation of customers having very old product versions, resulting in a direct effect that they experience bugs or reduced detection rates.

System Requirements:

- Windows Server 2003 (32-bit or 64-bit), SP2
- Windows Server 2003 (32-bit or 64-bit) with activated terminal services, SP2
- Windows Server 2008 (WebServer Edition, Standard Edition, Datacenter Edition, Enterprise Edition) 32-bit or 64-bit, with Terminal Server Support
- Windows Server 2008 R2 (Standard Edition, Enterprise Edition, Datacenter Edition and Foundation Edition), 64-bit only
- Citrix Presentation Server up to version 4.x inclusive

RAM dedicated for Avira Server

- 512 MB, 2 GB recommended (Windows Server 2003)
- 1024 MB (Windows Server 2008)

HDD

- At least 150 MB (additional temporary and quarantine space needed)

Computer

- Pentium computer with at least 1 GHz CPU

Note:

Administrator rights are required for installation under Windows.
